Business Scenario

Requirements & Solutions

After studying this topic, you should be able to:

-  Define functional and non-functional requirements.
-  Identify functional and non-functional requirements for the given integration needs in a business scenario.

Introduction

The implementation of an integration solution generally requires identifying **functional and non-functional requirements**. Functional requirements are mandatory and describe the **features or functions** of the system, such as the functionality of a particular integration feature in Salesforce. Example of a functional requirement is that a user would like to obtain order data from an external system by clicking a quick action on an opportunity record page in Salesforce. On the other hand, non-functional requirements describe **how the features or functions of the system should perform**. Examples include **data volume, scalability, security**, etc.

Overview

Functional Requirements

Functional requirements describe the **features** and **functions** of a system that allow users to **accomplish their tasks**.

Non-Functional Requirements

Non-functional requirements describe **how the features of functions** of a system should **perform**. Examples include data volume, security, scalability, etc.

Functional Requirements

Functional requirements describe **system behavior** and allow users to **accomplish their tasks**.

❖ DEFINITION

Functional requirements describe the **features or functions** of a system under specific conditions that enable users to **accomplish** their tasks.

❖ CONSIDERATIONS

Functional requirements specify the **results** and drive the **application architecture** of a system. They are usually defined with the help of end-users and are **mandatory** for implementation.

❖ EXAMPLE

When a Salesforce user updates the stage of an opportunity in Salesforce to 'Closed Won', opportunity data should be sent to the ERP system for the creation of an order.

Non-Functional Requirements

Non-functional requirements describe **how a system should perform**.

❖ DEFINITION

Non-functional requirements describe the **criteria** used to describe **how the features or functions of a system should perform**. In other words, they are used to define the **quality attributes**.

❖ TYPES

There are various **types of non-functional requirements**, such as **data retention, data volume, maintainability, performance, resilience, scalability, security**, etc.

❖ EXAMPLE

A user should be able to retrieve order data from the ERP system using a quick action in less than five seconds.

Business Scenario

Table of Contents 

Business Scenario: Part 1

Read the business scenario below and determine the most appropriate solutions for the company's requirements.

Cosmic Pharma is a worldwide pharmaceutical company that sells its products through different channels. The European division has offices in 17 countries, including Spain, France, Germany, and others.

It currently has over 20,000 employees, including more than 300 call center agents, supporting 30,000+ pharmacies by phone. The company has implemented Salesforce as its primary CRM. Multiple roles in the company use it.

Business Scenario: Part 2

Read the business scenario below and determine the most appropriate solutions for the company's requirements.

The call center agents use Salesforce daily to receive customer calls, handle cases, create sales orders requested by pharmacists, and answer their questions. They also use the ERP system to input the final order information after finishing a customer call.

The Chief Information Officer has decided to integrate Salesforce with the ERP system to ensure that agents do not have to work separately in the two systems. First, however, the solution architect of the company needs to define the functional and non-functional requirements based on the integration needs.

Requirements & Solutions

[Table of Contents](#)

Requirement 1

SCENARIO

The call center agents should be able to take sales orders through Salesforce. The list of products they see while taking an order and the corresponding prices should be up-to-date. The ERP system is the data master of products and prices. Also, the price calculation engine exists in the ERP system and will not be re-implemented in Salesforce. The ERP system should process the final order in real-time.

Solution 1: Part 1

SOLUTION

Functional requirements:

- A call center agent must be able to see the up-to-date list of products when creating an order.
- The agent must be able to request price calculation for each order line item from the ERP system in real-time.
- When the agent creates an order in Salesforce, it must automatically appear in the ERP system in real-time.

Solution 1: Part 2

SOLUTION

Non-functional requirements:

- ♦ **Frequency** - Salesforce must be able to get product updates from the ERP system daily. Price updates must also be sent from the ERP system to Salesforce in real-time. In addition, any new orders created in Salesforce must be sent to the ERP system in real-time.
- ♦ **Data Volume** - Only the deltas of products (new and changed records) should be sent from the ERP system to Salesforce. All the requested orders and prices must be sent from the ERP system to Salesforce.
- ♦ **Performance** - Retrieving the price information must not take more than 5 seconds when a user requests it in real-time.
- ♦ **Maintainability/Scalability** - Implementing the integration should not require development when performing the roll-out for a new market.

Solution 1

Requirement 2

SCENARIO

After a sales order is created by a call center agent, the customer is able to pay for it online via a self-service web app. The web app is integrated with the payment app to get the payment status. It also stores the customers' payment information, which includes the payment cards data. For security reasons, the app doesn't allow processing payments with a credit/debit card added to the system less than one hour ago.

While on a call with a customer, a call center agent should be able to address a case related to order payment status and have access to all the required information in Salesforce. To accomplish this, the web app should send all the payment information and the payment status update to Salesforce as soon as any changes occur.

Solution 2: Part 1

SOLUTION

Functional requirements:

- ❖ The call center agent must be able to see the up-to-date payment status in Salesforce during a customer call.
- ❖ The call center agent must be able to see the customer's credit/debit card information in Salesforce during the customer call.

Non-functional requirements:

- ❖ **Frequency**
Card information updates must be sent from the web app to Salesforce hourly. Payment status update must be sent from the web app to Salesforce in real-time.

Solution 2: Part 2

❖ Data Volume

Only the delta (new and changed details) of the customer card information must be sent from the web app to Salesforce. Only the requested records must be sent from the web app to Salesforce for the payment status update.

❖ Security/Compliance

Handling of the customer's card information must be PCI-compliant (Payment Card Industry).
