[Business Scenario](#)

[Requirements & Solutions](#)

After studying this topic, you should be able to:

- ✎ Identify the types of business growth and regulatory factors that can influence the choice of integration solutions.
- ✎ Identify the business growth and regulatory factors that can influence the choice of integration solutions in the given business scenarios.

Introduction

The choice of integration solutions can be impacted by **business growth and regulatory factors**. Business growth can be in the form of a new business sector in a foreign country or customer base expansion through marketing initiatives. Establishing a business in a new country may require integrating additional enterprise systems or using a separate Salesforce org.

Laws and regulations such as the **GDPR, LGPD, and PIPL** can affect the choice of integration solutions. For instance, to comply with the GDPR, it may be necessary to delete customer data stored in Salesforce when it is no longer needed.

An architect should also take into account certain **considerations** while designing integration solutions based on business factors and regulations. One of the important design considerations is that the integration solution should be based on the company's **interpretation of the regional law(s)**.

Business Growth & Regulatory Factors

BUSINESS GROWTH FACTORS

When a company wants to expand or grow its business, it can have an impact on the choice of integration solutions. For example, establishing an office in a new country may require integrating an additional enterprise system.

REGULATORY FACTORS

Laws and regulations, such as GDPR and PIPL, can have an impact on the choice of integration solutions. For example, it may be necessary to delete the customer data stored in Salesforce when it is no longer needed.

Business Growth & Regulatory Factors

Business growth and the need to comply with **regulations** can influence the choice of integration solutions.

❖ BUSINESS GROWTH FACTORS

When a company wants to **expand or grow** its business, it may impact the choice of integration solutions used to integrate its enterprise systems with one another.

❖ REGULATORY FACTORS

Certifications, standards, and regulations can affect the integration architecture. For example, to comply with **restricted processing in GDPR, APIs** can be used to automate the deletion of data.

Business Growth Impact

There are two main types of **business growth factors** that can influence the integration solutions implemented by the company.

❖ NEW BUSINESS SECTORS

If a company needs to establish new business sectors, such as **new offices in additional countries**, the design of integration solutions being utilized could require reconsideration.

❖ CUSTOMER BASE EXPANSION

If a company expands their **customer base (e.g., through marketing initiatives)**, existing integration solutions may need to be revamped in order to ensure scalability.

❖ EXAMPLE

If additional enterprise systems are used by new offices, an integration solution design that comprises integration with the company's Salesforce org may require including the new enterprise systems.

Impact of Regulatory Factors

Laws and regulations such as GDPR can influence the integration solutions implemented by the company.

❖ GDPR

GDPR, or General Data Protection Regulation, is a law for citizen privacy in the European Union which can be grouped into six main areas (**consent, security, transparency and accountability, restricted processing, portability, and the right to be forgotten**).

❖ IMPACT OF GDPR

GDPR can have an impact on the choice of integration solutions. For example, to comply with **restricted processing**, **APIs** can be used to automate the deletion of data when it is no longer required, and similarly, to comply with **portability**, **APIs, Data Loader, or AppExchange apps** can be used to offload or exchange data.

Impact of Regulatory Factors

Laws and regulations such as GDPR can influence the integration solutions implemented by the company.

❖ OTHER LAWS

Other laws such as **LGPD in Brazil** and **PIPL in China** may also have an impact on the choice of integration solutions. For example, PIPL requires that the information of Chinese citizens should not be stored overseas, which can make it necessary use regional storage or the implementation of a multi-org strategy.

Considerations

Certain considerations are applicable for designing integration solutions based on **business factors and regulations**.

❖ INTERPRETATION OF LAWS

The integration solution should be based on the company's **interpretation of any law(s) that apply to the region**. Factors that can influence it include **definitions of regulated data, sector-specific regulated data, regulated data thresholds**, how the **investment cost compares with future business forecast** in the local jurisdiction, and **residency and processing requirements**.

❖ DOCUMENTATION

Salesforce data flows within the enterprise must be documented. Documentation can include **logical entities and systems of record, physical entity and attributes, processing activity, outbound interfaces and APIs, external and primary keys**, etc.

Considerations

Certain considerations are applicable for designing integration solutions based on **business factors and regulations**.

❖ MULTI-ORG OR POINT OF PRESENCE

Creating a **separate Salesforce org** that can **host and process local data** may be considered. A **local point of presence** may require **data hosting, data hashing/redaction, inbound APIs and composite services, two-way replication services**, etc.

❖ USER EXPERIENCE

To ensure a consistent global user experience, **dynamic components** may be included in the integration solution design based on a **user's locale**. For example, dynamic data display can be used in a Lightning web component that is integrated with an external system.

Considerations

Certain considerations are applicable for designing integration solutions based on **business factors and regulations**.

❖ CLEAR PRINCIPLES

Clear principles should be set for developers and designers. These include **organizational, technical, and UX principles** that are instructive to low-level designs and user stories.

Business Scenario

Table of Contents 

Business Scenario

Read the business scenario below and determine the most appropriate solutions for the company's requirements.

Cosmic Pharma is a pharmaceutical company that sells products through different channels. The company has its headquarters in New York. It currently has more than 5,000 employees and hundreds of thousands of patients who take prescribed drugs on a daily basis. It has implemented Salesforce as its primary CRM that is used by different roles. As a part of its business growth strategy, it plans to establish its business in new countries, especially by acquiring new companies.

The Chief Information Officer has found it necessary to review the existing integration architecture to ensure its alignment with the rollout plan and the regulatory restrictions of new countries. The solution architect needs to identify the business growth and regulatory factors that can impact the integration solutions.

Requirements & Solutions

[Table of Contents](#)

Requirement 1

SCENARIO

All the orders created in Salesforce are currently sent to an ERP system using a point-to-point integration based on outbound messaging. As a part of the planned business growth, Cosmic Pharma plans to acquire another company based in France. The French company is expected to use the same Salesforce instance but has its own homegrown ERP system. There is no plan to migrate to the main ERP system used by Cosmic Pharma. The CEO is also planning to acquire additional companies in other regions. At the moment there is no information about the ERP systems being used by them, but they are also expected to use the same Salesforce instance and CRM functionality. The new integration architecture should take into account all the planned rollouts. The solution architect needs to identify the relevant business growth and regulatory factors that could impact the choice of integration solutions.

Solution 1

SOLUTION

The acquisition of a new company implies the addition of a **new business sector**. Since the new company is in France, which is in the European Union, the **GDPR** should also be taken into consideration. It's recommended to introduce a **middleware** instead of the point-to-point integration being used by the company. The middleware should contain the transitional database and perform all the required **data transformation**. Integration between Salesforce and the middleware can be implemented once with no need to implement changes for any new rollouts. And to ensure compliance with the main areas of the **GDPR**, Salesforce core capabilities such as the **Individual object, roles, permissions, and APIs** can be utilized.

Solution 1

Requirement 2

SCENARIO

The pharmacists (customers of Cosmic Pharma) use a self-service web app to place orders. While placing the orders, they provide their personal data (Full Name, Email, Address, etc.). The web app is hosted on Heroku and integrated with Salesforce using Heroku Connect. The company has executed several marketing initiatives in China and is going to establish its business there. New integration architecture should take this into account, and any relevant factors that could impact the choice of integration solutions should be identified.

Solution 2

SOLUTION

Expanding a business in a new country through marketing initiatives is related to **customer base expansion** and establishment of a **new business sector**. **PIPL (China's Personal Information Protection Law)** should also be taken into consideration for this scenario. According to PIPL, **personal information of Chinese citizens can't be stored overseas**. The following changes to the integration and the overall architectural landscape should be considered:

- Introduce a **multi-org strategy** and use a **separate Salesforce instance** for China.
- Move the web app to **Heroku Private Spaces** to ensure geographical isolation.
- Use **Heroku Shield Connect** to integrate the back-end of the web app with both Salesforce instances.
